

Avoid hepatitis B and C viruses to reduce your cancer risk

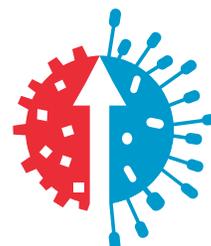

Hepatitis B and C viruses
(HBV and HCV)
increase cancer risk

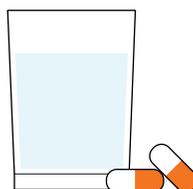

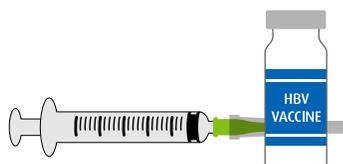

2% of Canadian adults
are chronically infected
with HBV or HCV*

510
new cancer cases
are due to HBV and HCV

The number of new cancer cases
due to HBV and HCV will increase
from 510 to **930** in 2042

Together, we could prevent about 1,800 cancer cases
by 2042 if fewer Canadians were infected with HBV and HCV
